Intravenous Pyelogram (IVP)
Consent for Contrast Material Injection (IODINE)

Your doctor has scheduled you for an x-ray examination that requires an injection of a contrast agent into your bloodstream. The contrast agent (also termed contrast material or “x-ray dye”) shows up white on x-ray images and helps the radiologist interpret them.

The contrast media is given through a small needle placed into a vein, usually on the inside of your elbow or on the back of your hand. Normally, contrast media is considered quite safe; however, any injection carries a slight risk of harm including injury to a nerve, artery or vein, infection, or reaction to the material being injected. Occasionally, a patient will have a mild reaction to the contrast agent and develop sneezing or hives. Uncommonly, a serious reaction to the contrast occurs. The physicians and staff of the imaging center are trained to treat these reactions. Very rarely, death has occurred related to contrast administration.

YES NO Do you have a known allergy to x-ray contrast material?

YES NO Do you have severe allergies or asthma?
Explain

YES NO Do you have multiple myeloma, sickle cell disease, polycythemia or pheochromocytoma?

YES NO Do you have a known abdominal aneurysm?

Generally, X-ray exams should not be performed on women who are pregnant or who may be pregnant.

YES NO Is there any possibility you are pregnant?

I attest that the above information is correct to the best of my knowledge and I have read and understand the content of this form. I agree to the administration of IV contrast.
